Hospital in Manchester  
UK

# Purpose of IQM

# IQM design

## Hardware Design (Prototype)

- ✓ Large Area Ion Chamber (550cc)
- ✓ Electrode plates made of 2mm Aluminum
- ✓ Enclosure made of PMMA
- ✓ Sensitive Area: 26cm x 26cm
- ✓ Max. Field Size: 40cm x 40cm
- ✓ Spatial sensitivity: 0.5%/mm

imrt-linac

5 REAL-TIME BEAM CONTROL STEERING SYSTEM

4 ACHROMATIC 3-FIELD BENDING MAGNET

6 FOCAL SPOT SIZE

2 ION CHAMBER

1 ASYMMETRIC JAWS

7 ENERGY SWITCH

3 MAP PROCESSOR

8 GRIDDED ELECTRON GUN

9 COMPUTERIZED MLC

Target

Flattening filter

MLC/Jaws

IQM (4.5mm Al)

# Integrating the IQM into Pinnacle 9.8

- 1. Comparison of data measured with & without IQM in plotting tank (6,10 &6FFF)**
- 2. Evaluation of IQM data against clinical models in Pinnacle 9.8**
- 3. Magnitude of adjustments assessed**
- 4. Plans delivered to Delta 4 through IQM**

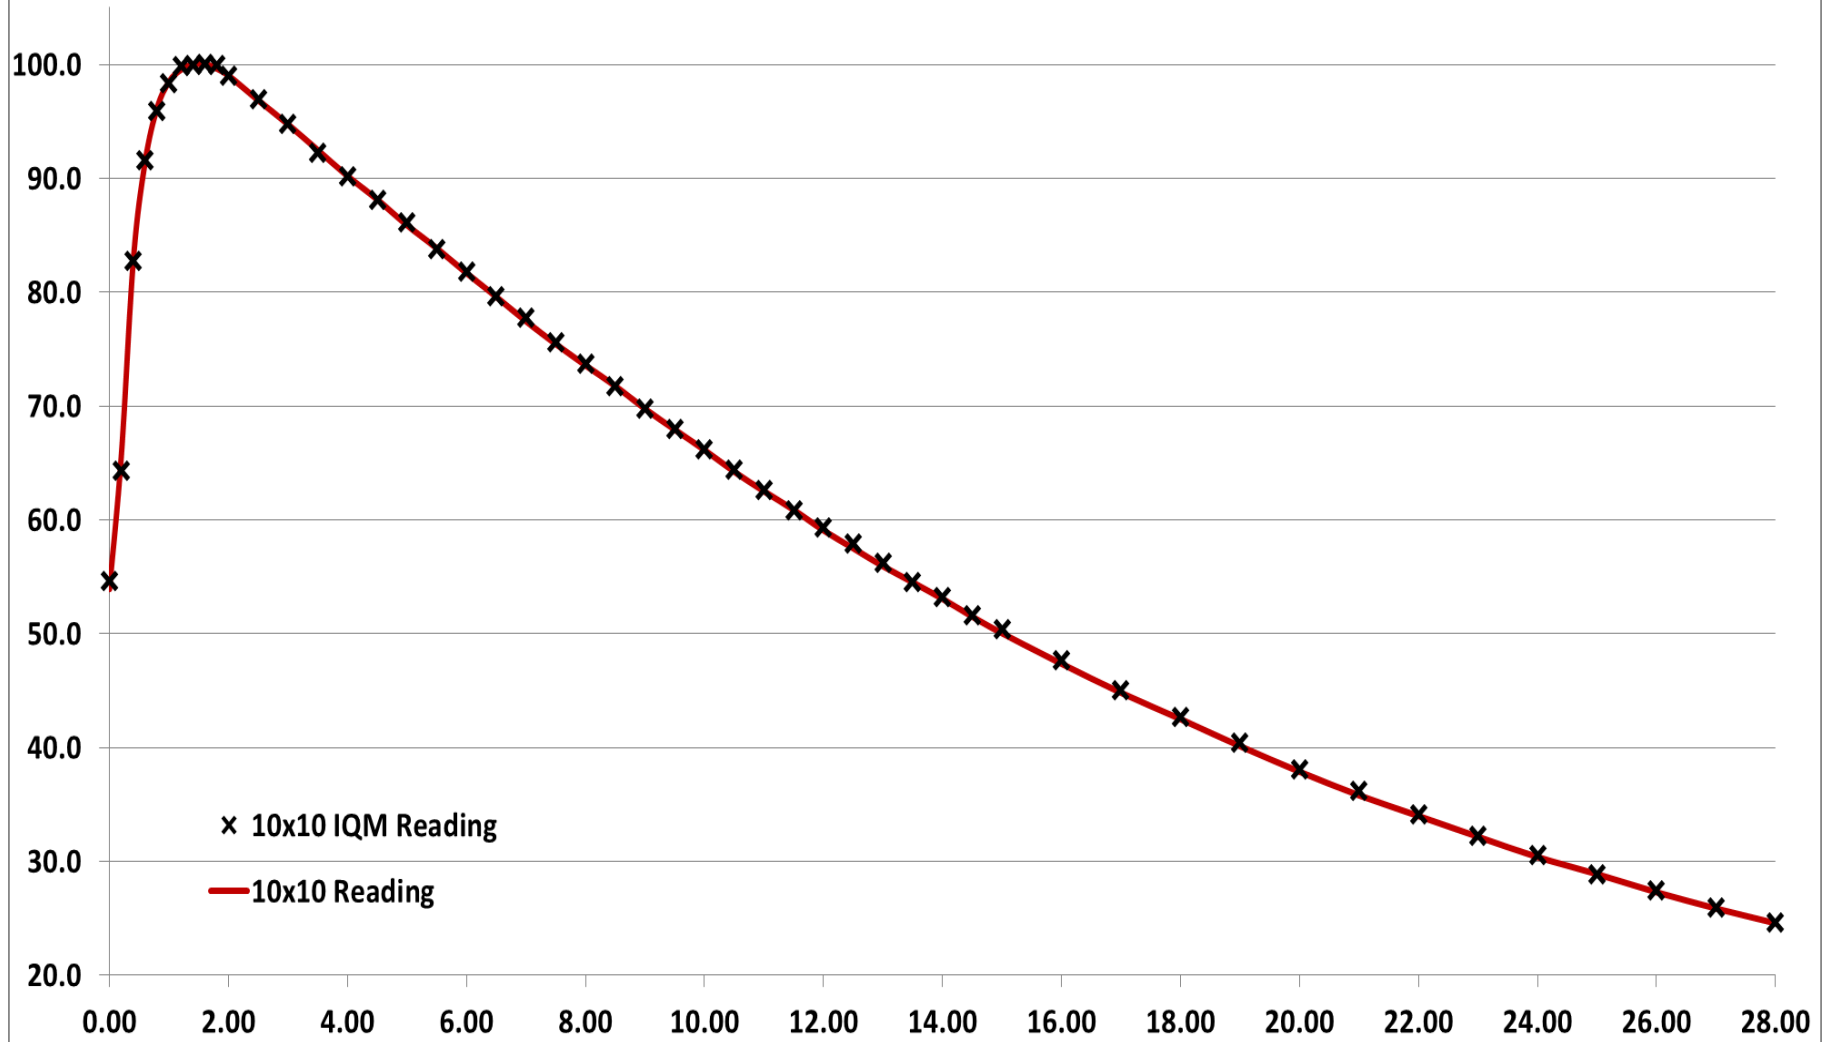

# Comparison of radiation beams – 6MV

PDD of 10x10cm field @6MV (Open and with IQM normalised to 10cm deep)

# Comparison of radiation beams – 6MV

## Y profile, 6MV, 10x10cm field 90cm SSD

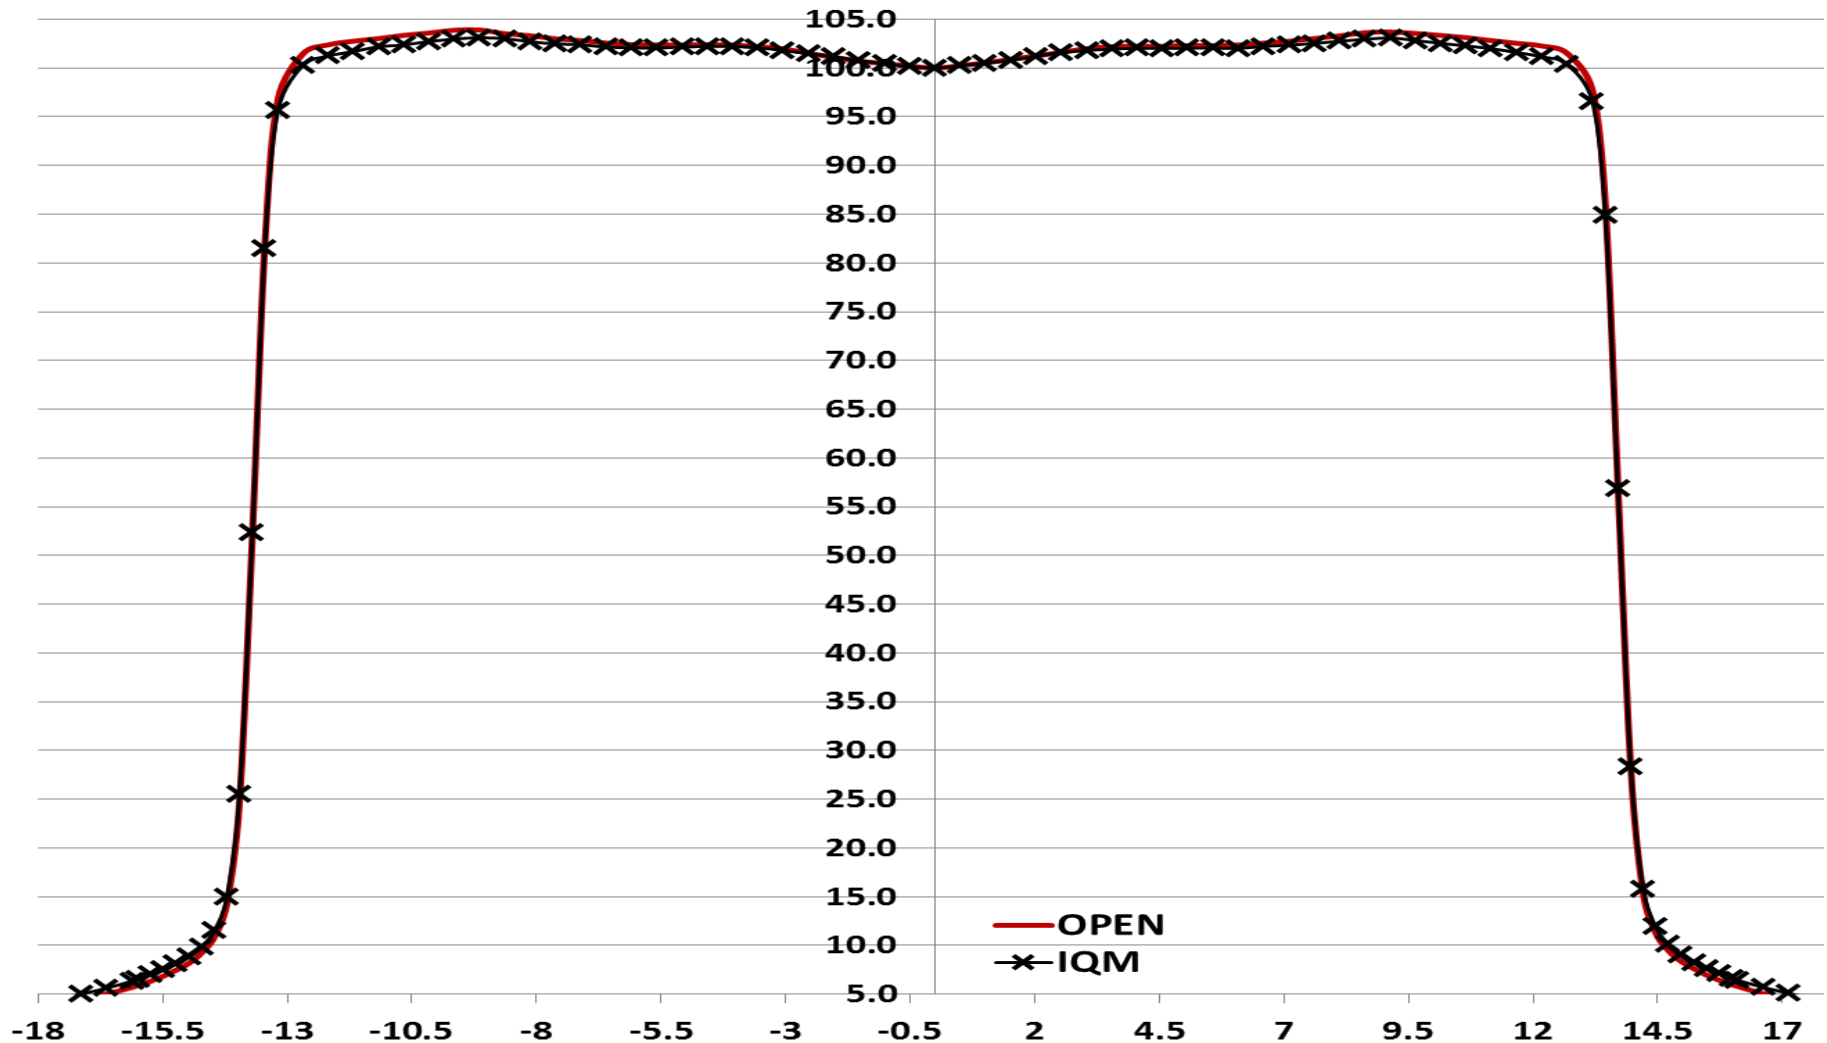

# Comparison of radiation beams – 6MV

PDD for 30x30cm field at 6MV (Open and with IQM normalised to 10cm deep)

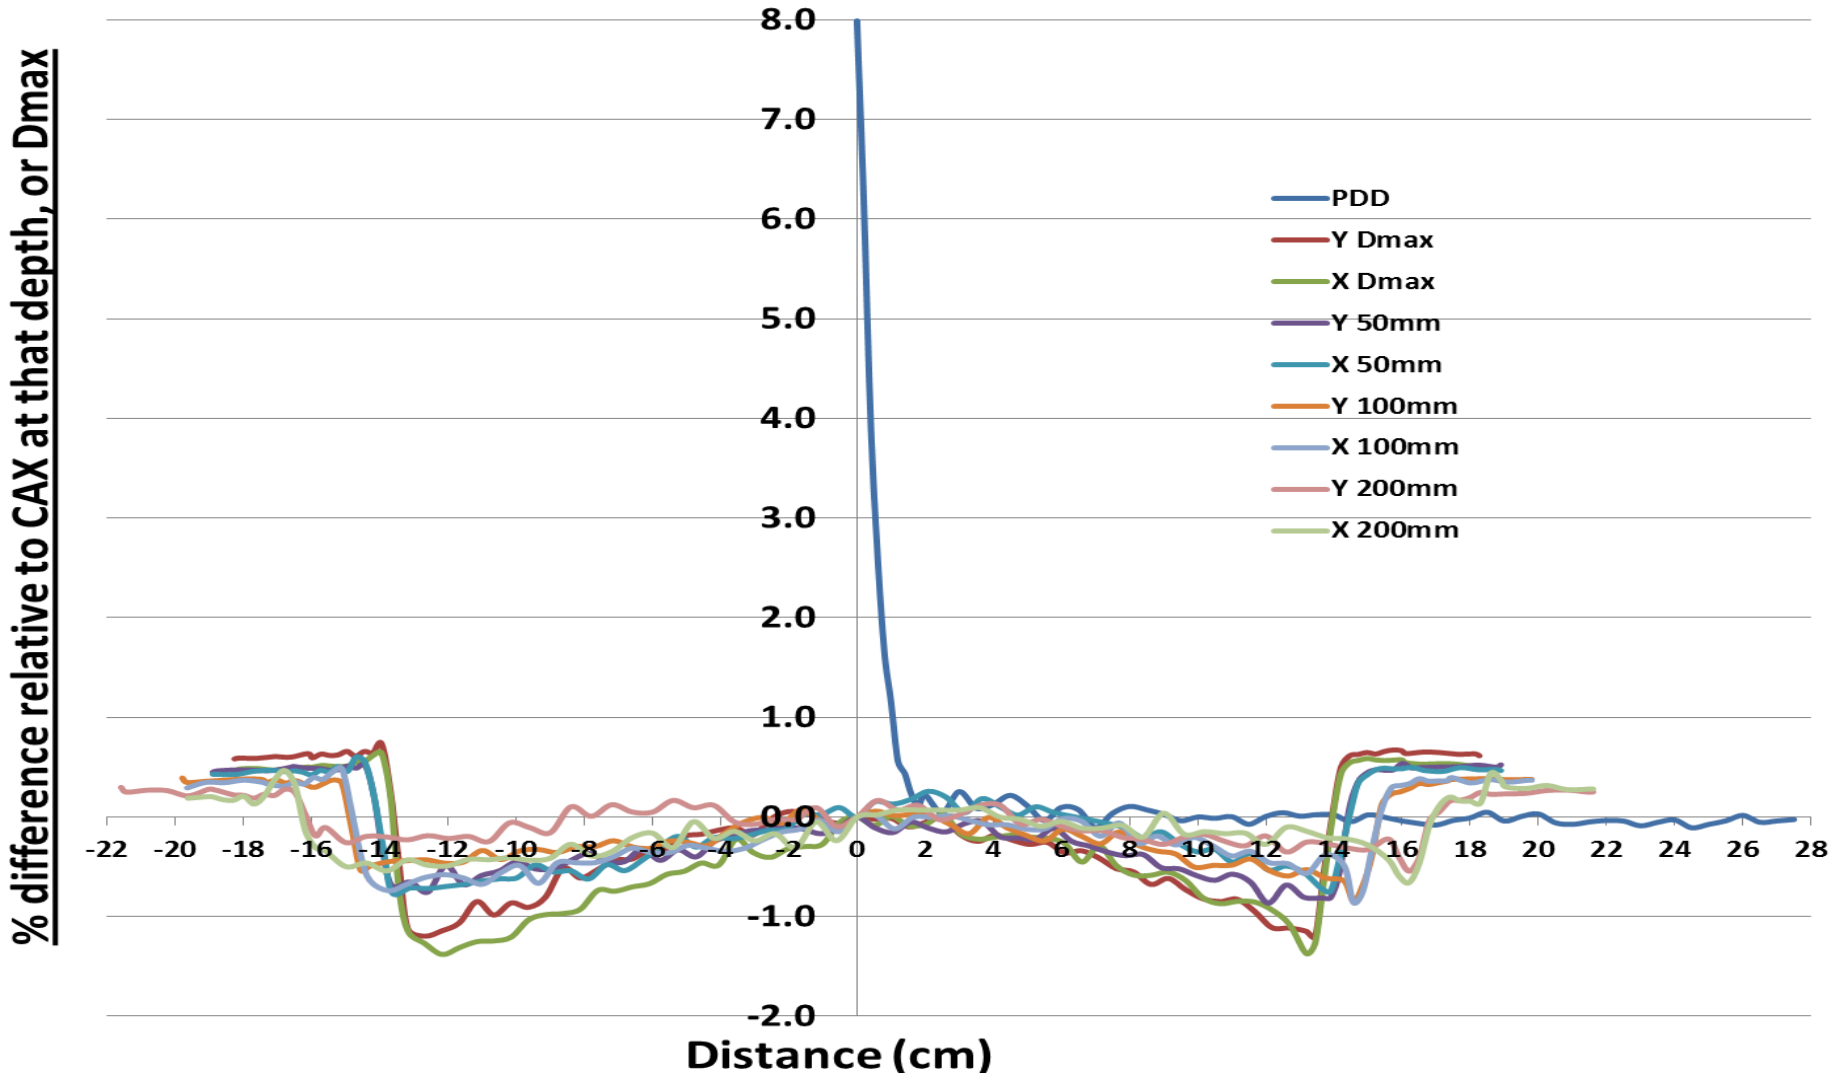

# Comparison of radiation beams – 6MV

Y-Profile for 30x30cm field @Dmax 6MV

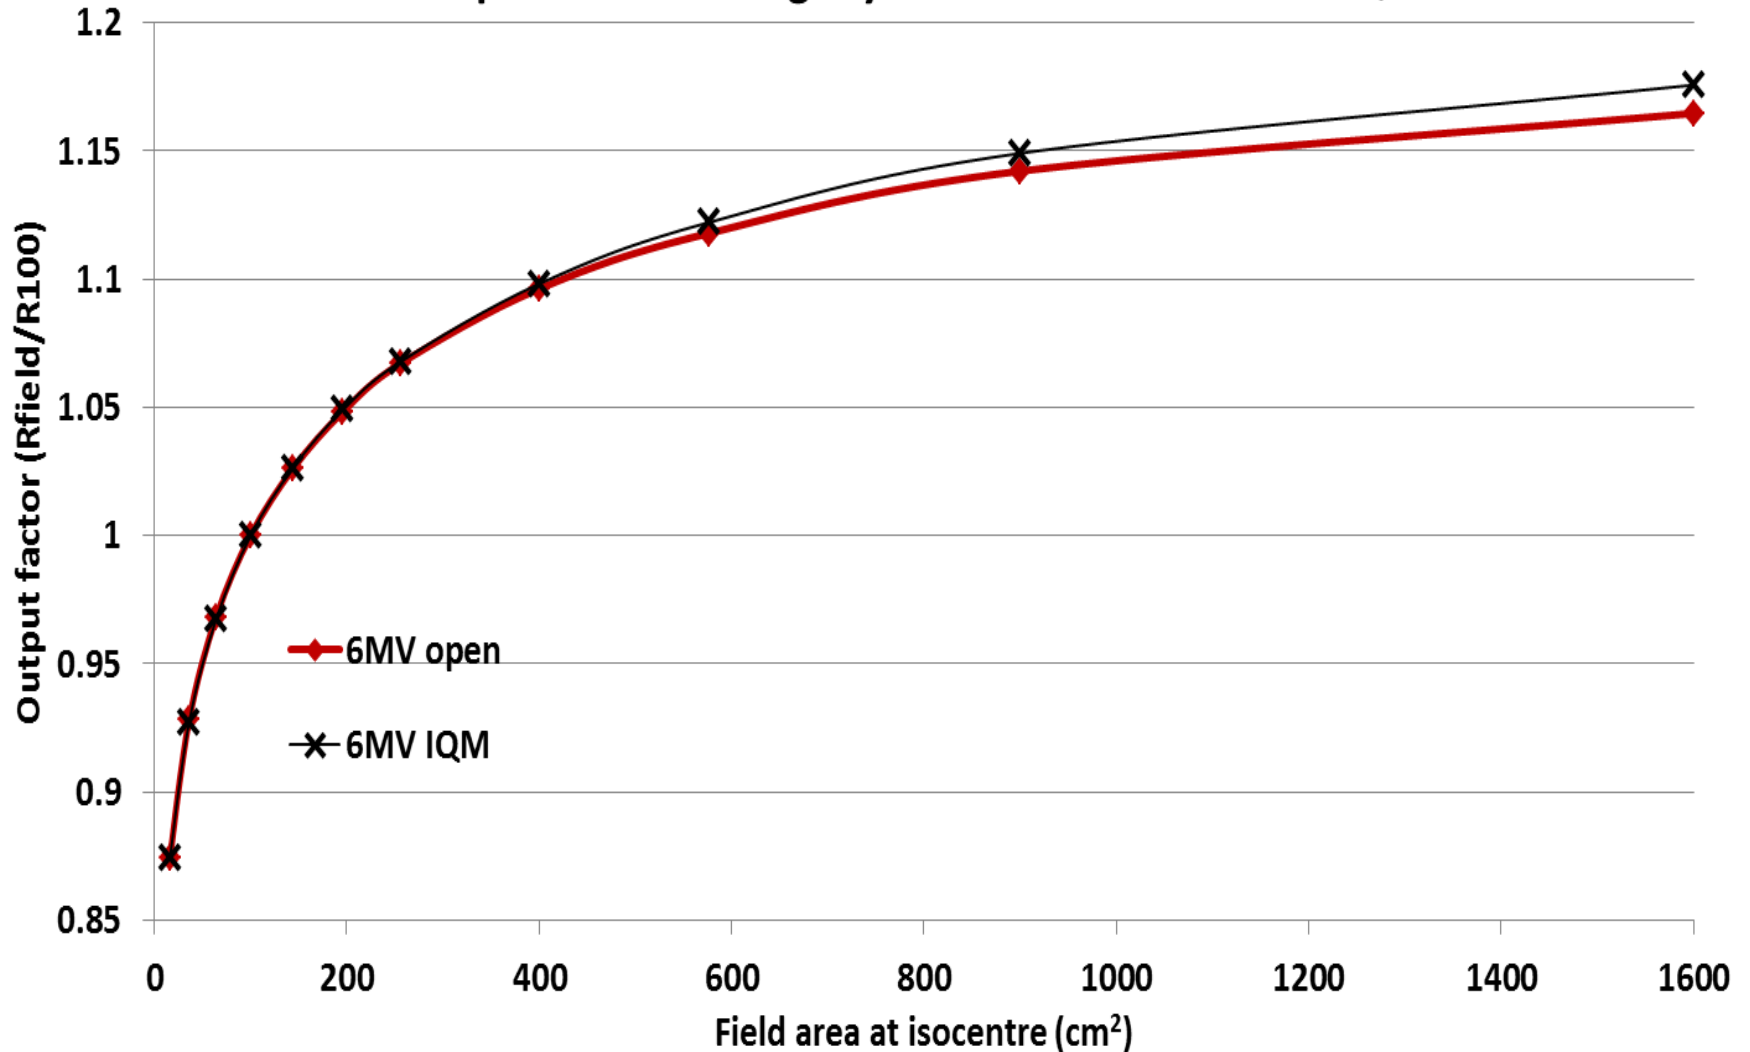

# Comparison of radiation beams – 6MV

Percentage difference between Open and IQM fields 6MV 30x30cm

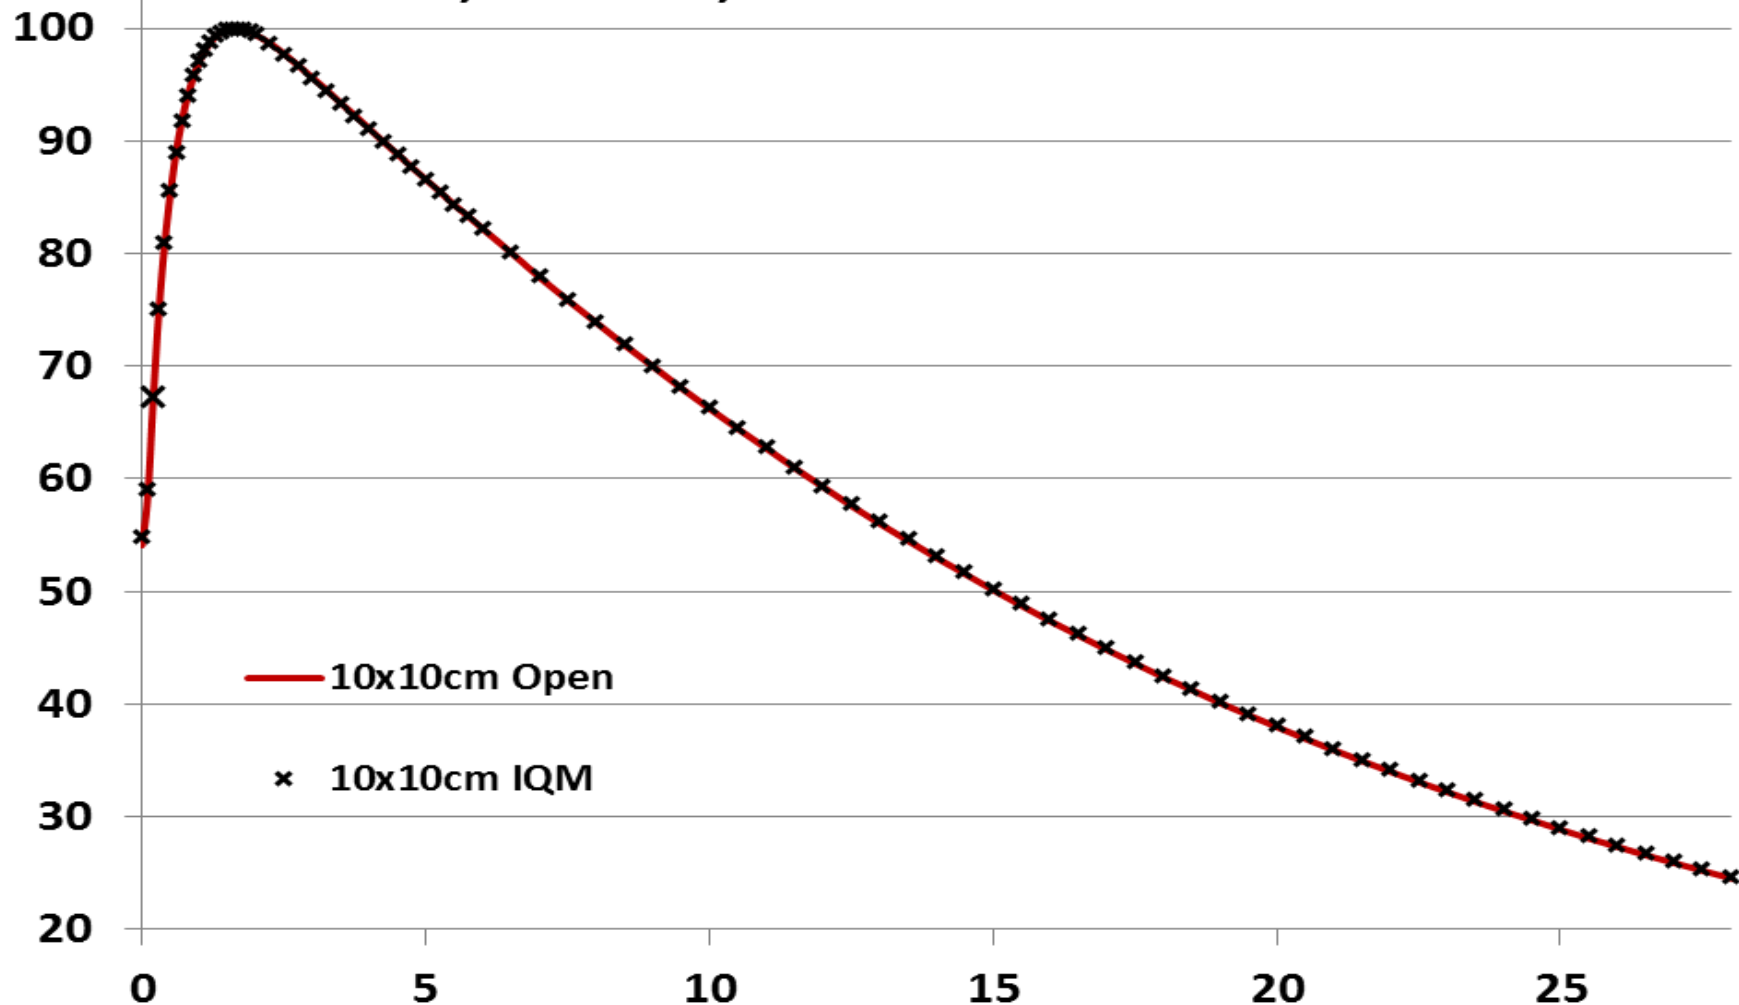

# Comparison of radiation beams - 6MV

6MV Output factors for Agility linac with and without IQM

# Comparison of radiation beams – 6FFF

PDD, 6MVFFF, 10x10cm field 90cm SSD

# Comparison of radiation beams – 6FFF

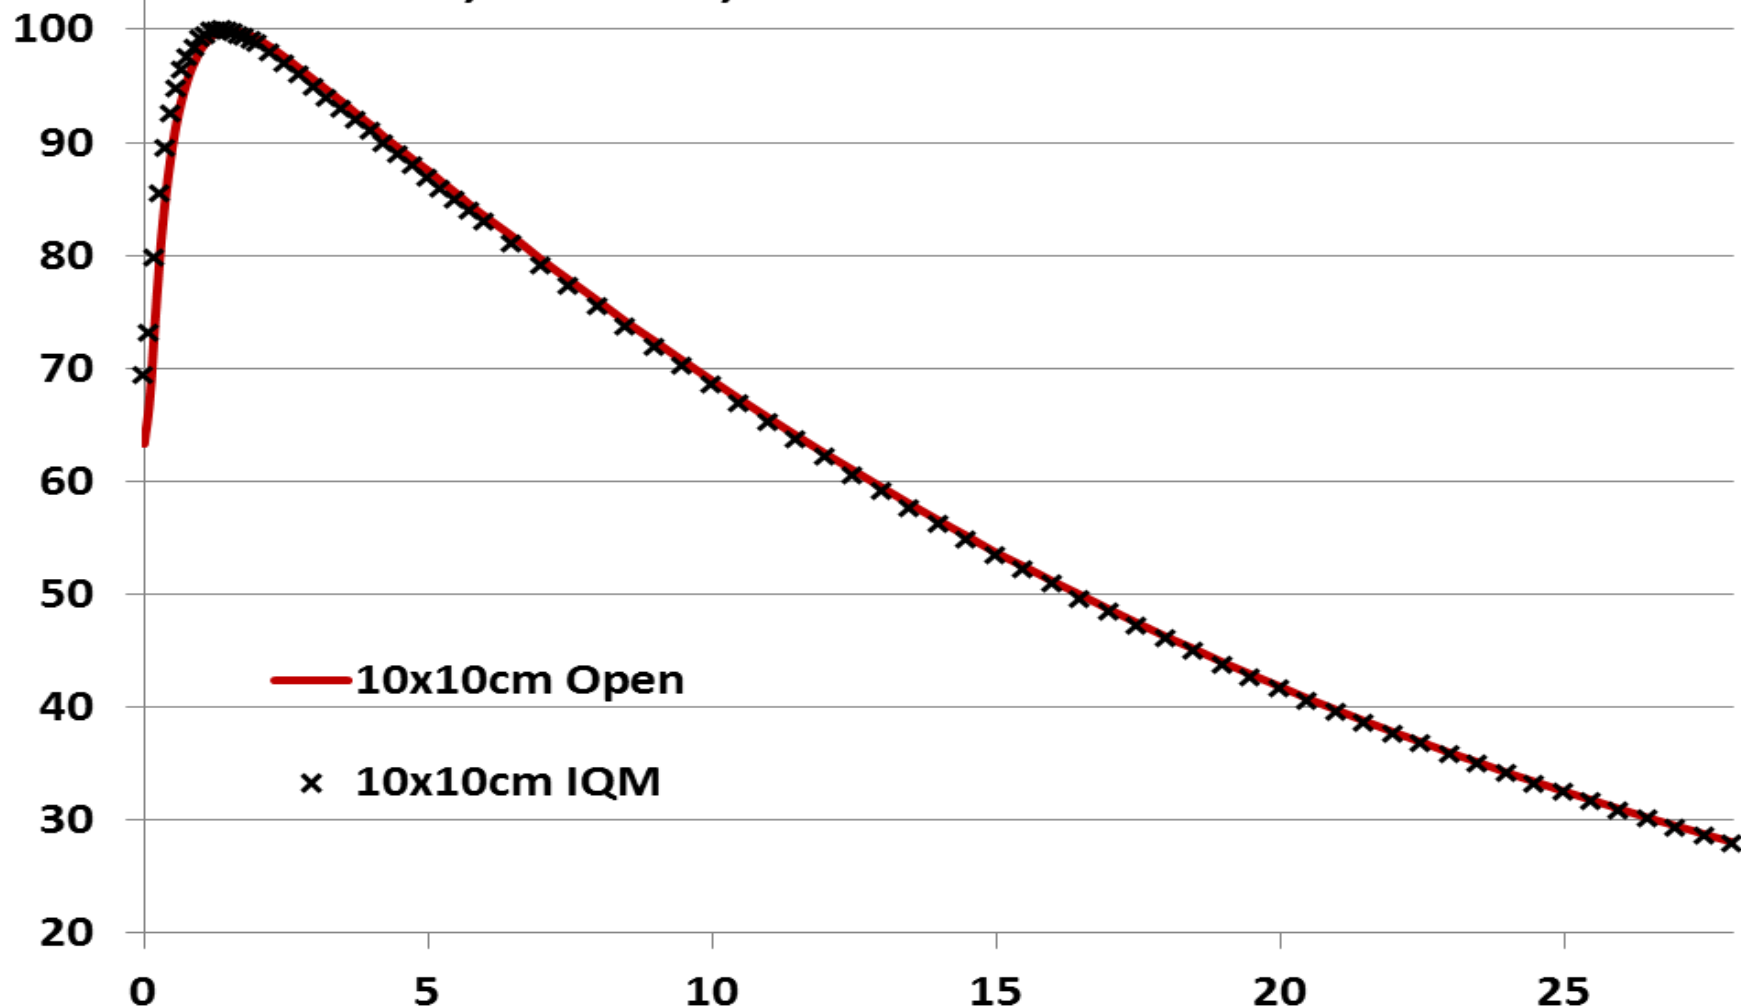

Y profile, 6MVFFF, 10x10cm field 90cm SSD

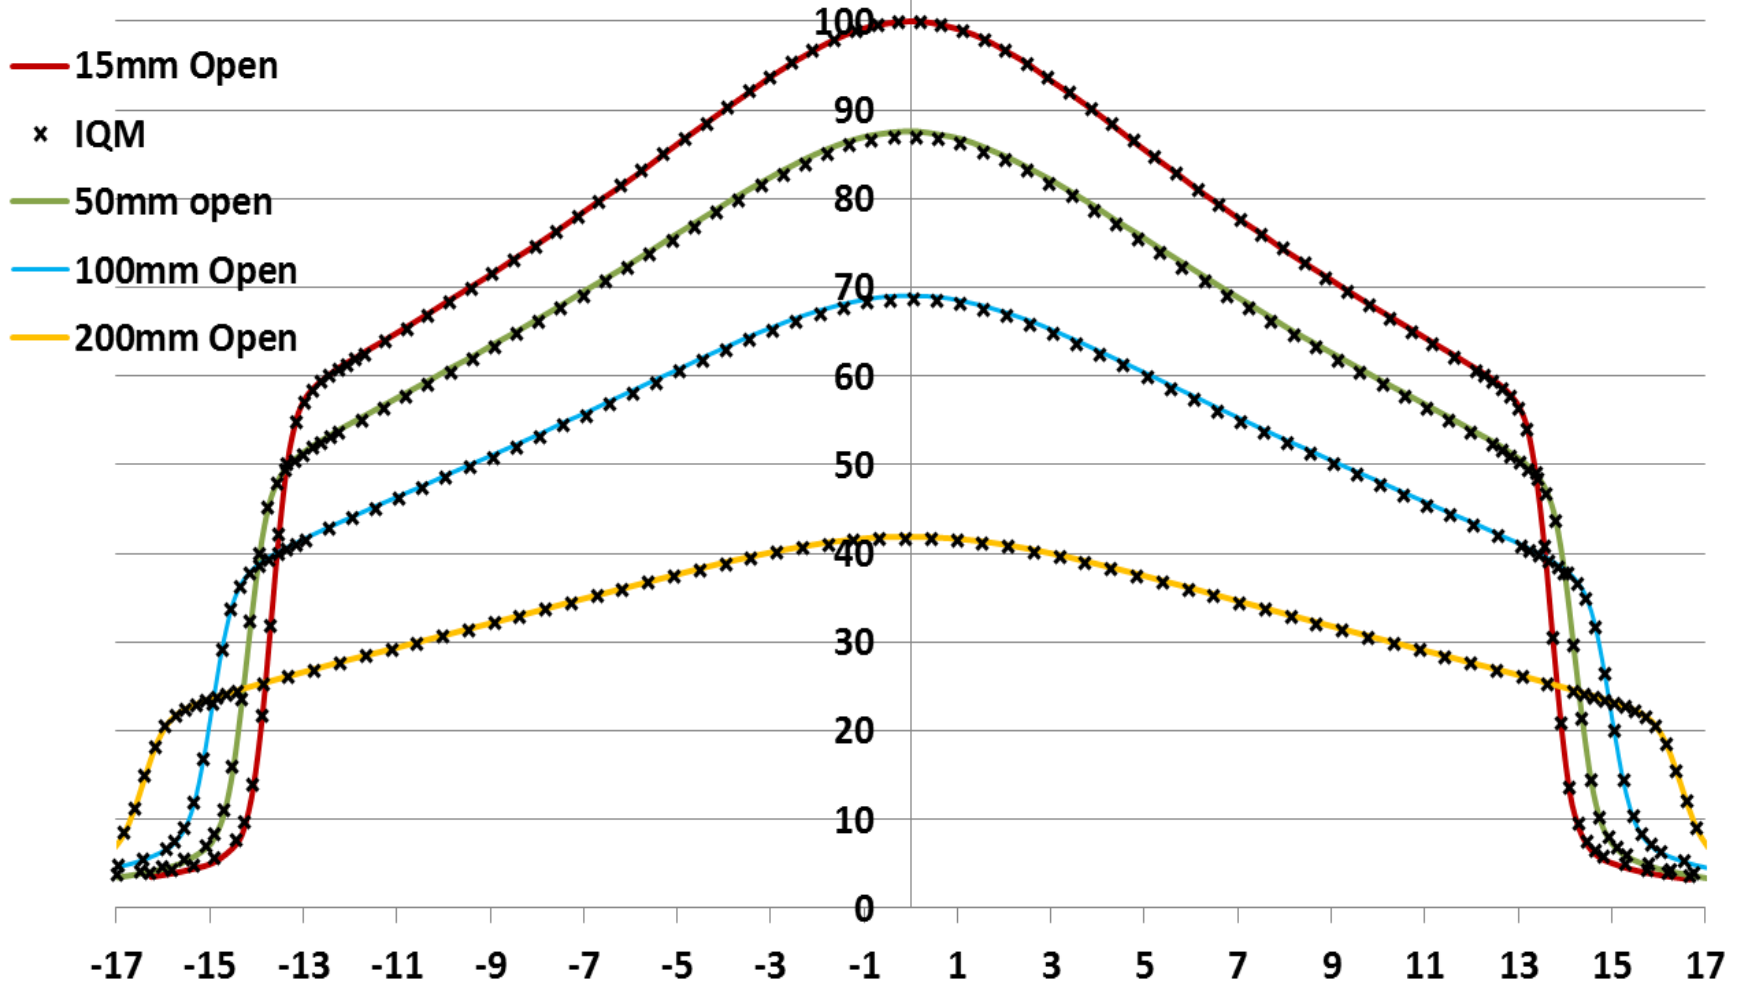

# Comparison of radiation beams – 6FFF

PDD, 6MVFFF, 30x30cm field 90cm SSD

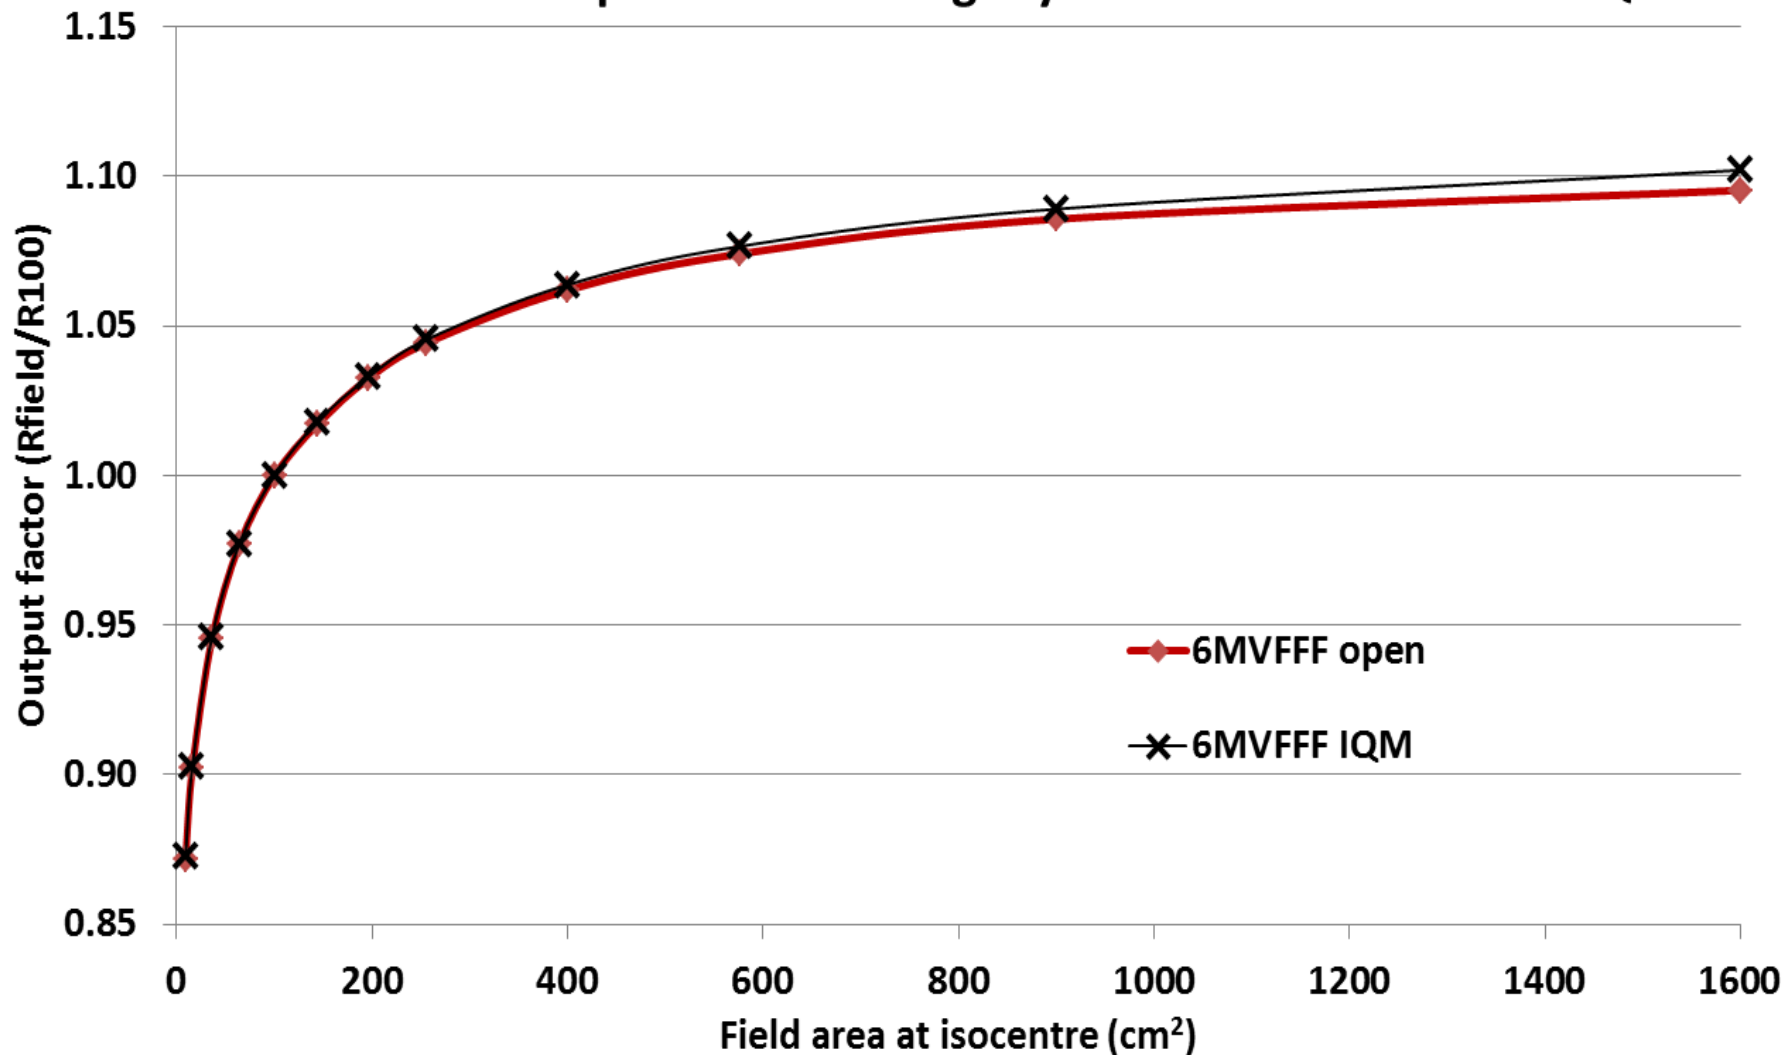

# Comparison of radiation beams – 6FFF

Y profile, 6MVFFF, 30x30cm field 90cm SSD

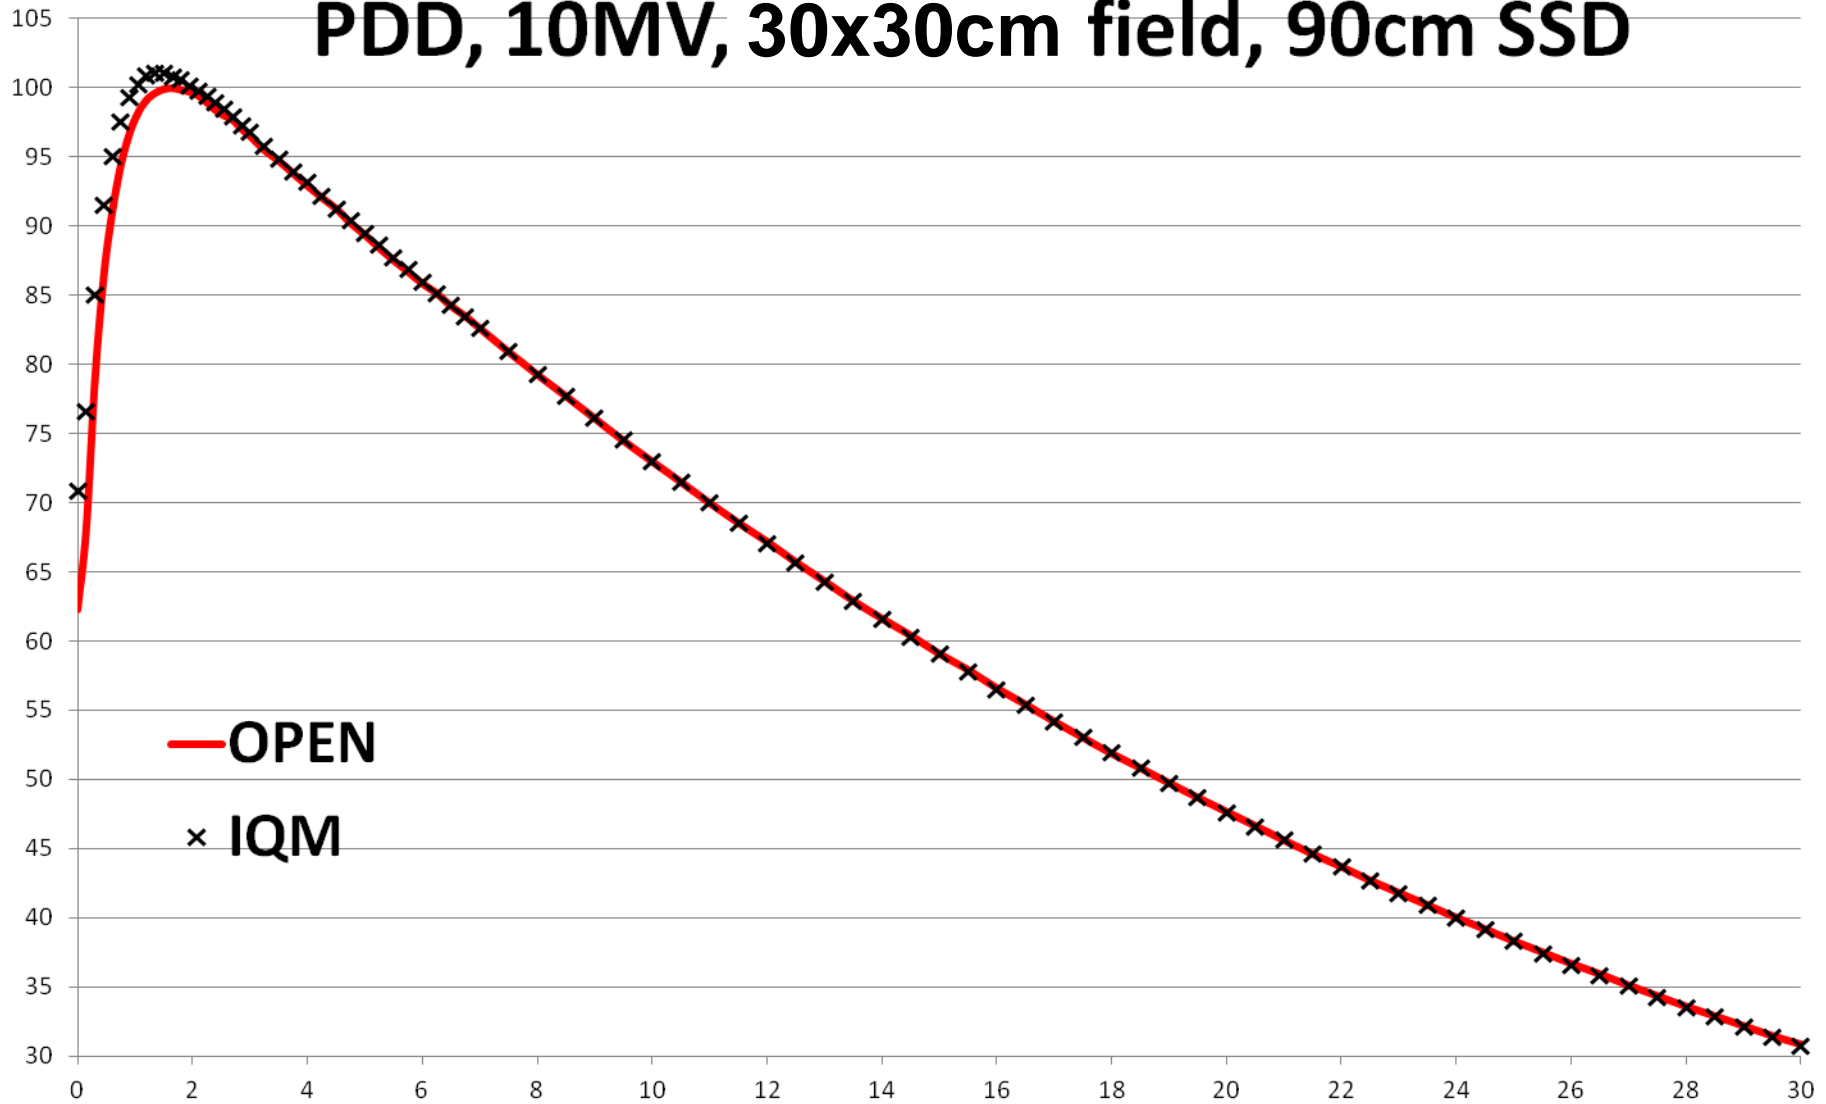

# Comparison of radiation beams – 6FFF

6MVFFF Output factors for Agility linac with and without IQM

# Comparison of radiation beams 10MV

## PDD, 10MV, 30x30cm field, 90cm SSD

# Attenuation effect of IQM

| Energy                                | Attenuation factor |
|---------------------------------------|--------------------|
| 6MVFFF (TPR <sub>20/10</sub> = 0.683) | 0.946              |
| 6MV (TPR <sub>20/10</sub> = 0.686)    | 0.946              |
| 10MV (TPR <sub>20/10</sub> = 0.733)   | 0.959              |

- Variation of  $\pm 0.3\%$  for fields  $30 \times 30 \text{cm}^2$  or less.

# Integrating the IQM in into P<sup>3</sup> (Summary 1)

- 1. No significant differences in O/P factors**
- 2. Attenuation fixed amount for each energy**
- 3. IQM has little effect on PDD beyond D<sub>max</sub> or on profiles <20x20cm**
- 4. For 6&10MV modelling at larger radial distances needed review**

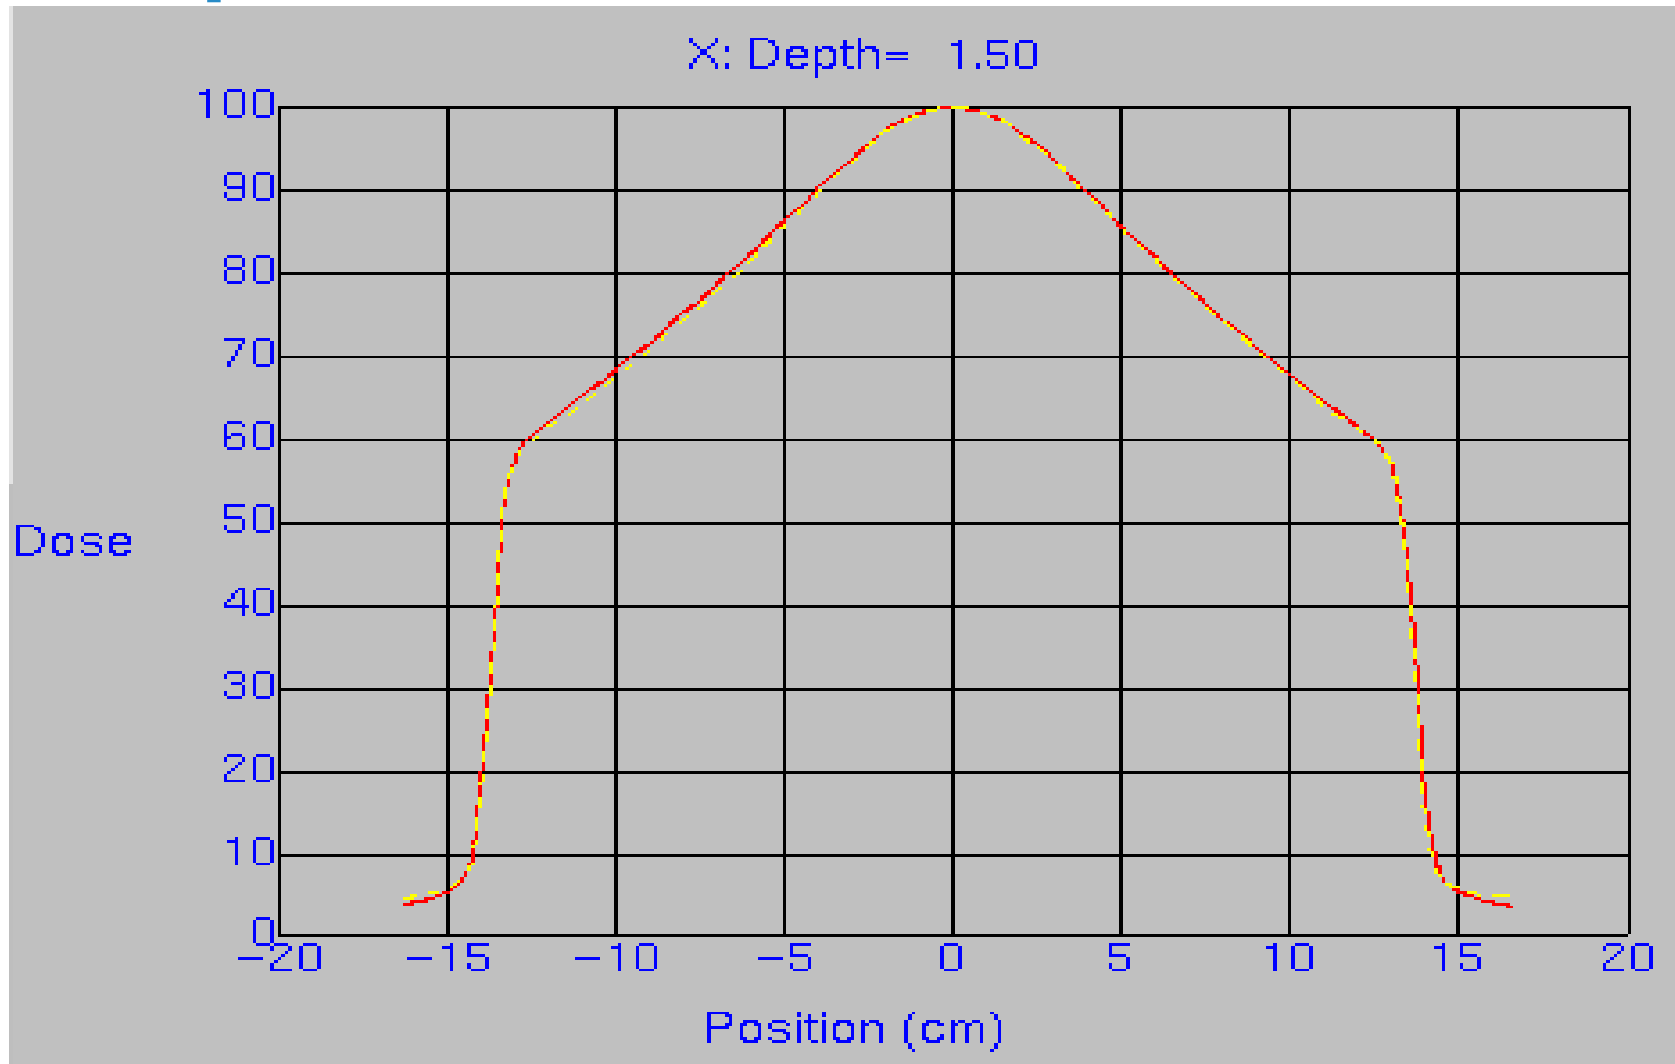

# Integrating the IQM into Pinnacle 9.8

## Comparison with existing clinical models

# Open – Clinical model @6MVFFF

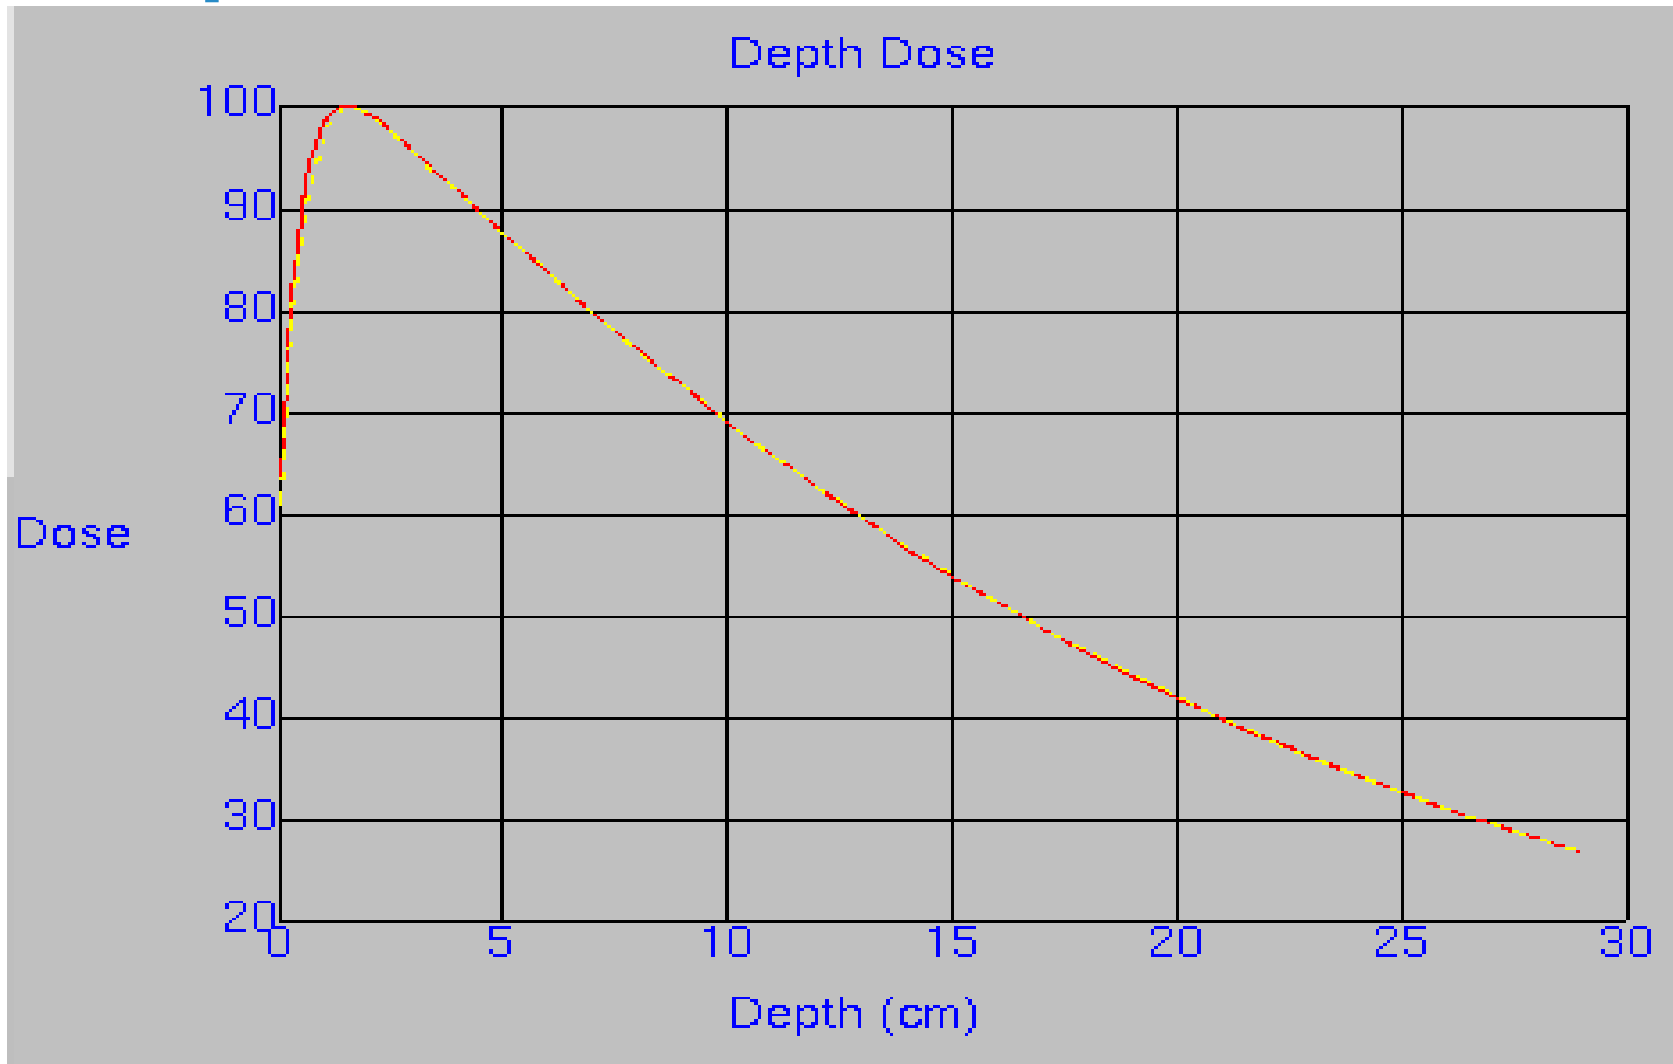

# IQM – Clinical model @6MVFFF

# Open – Clinical model @6MVFFF

# IQM – Clinical model @6MVFFF

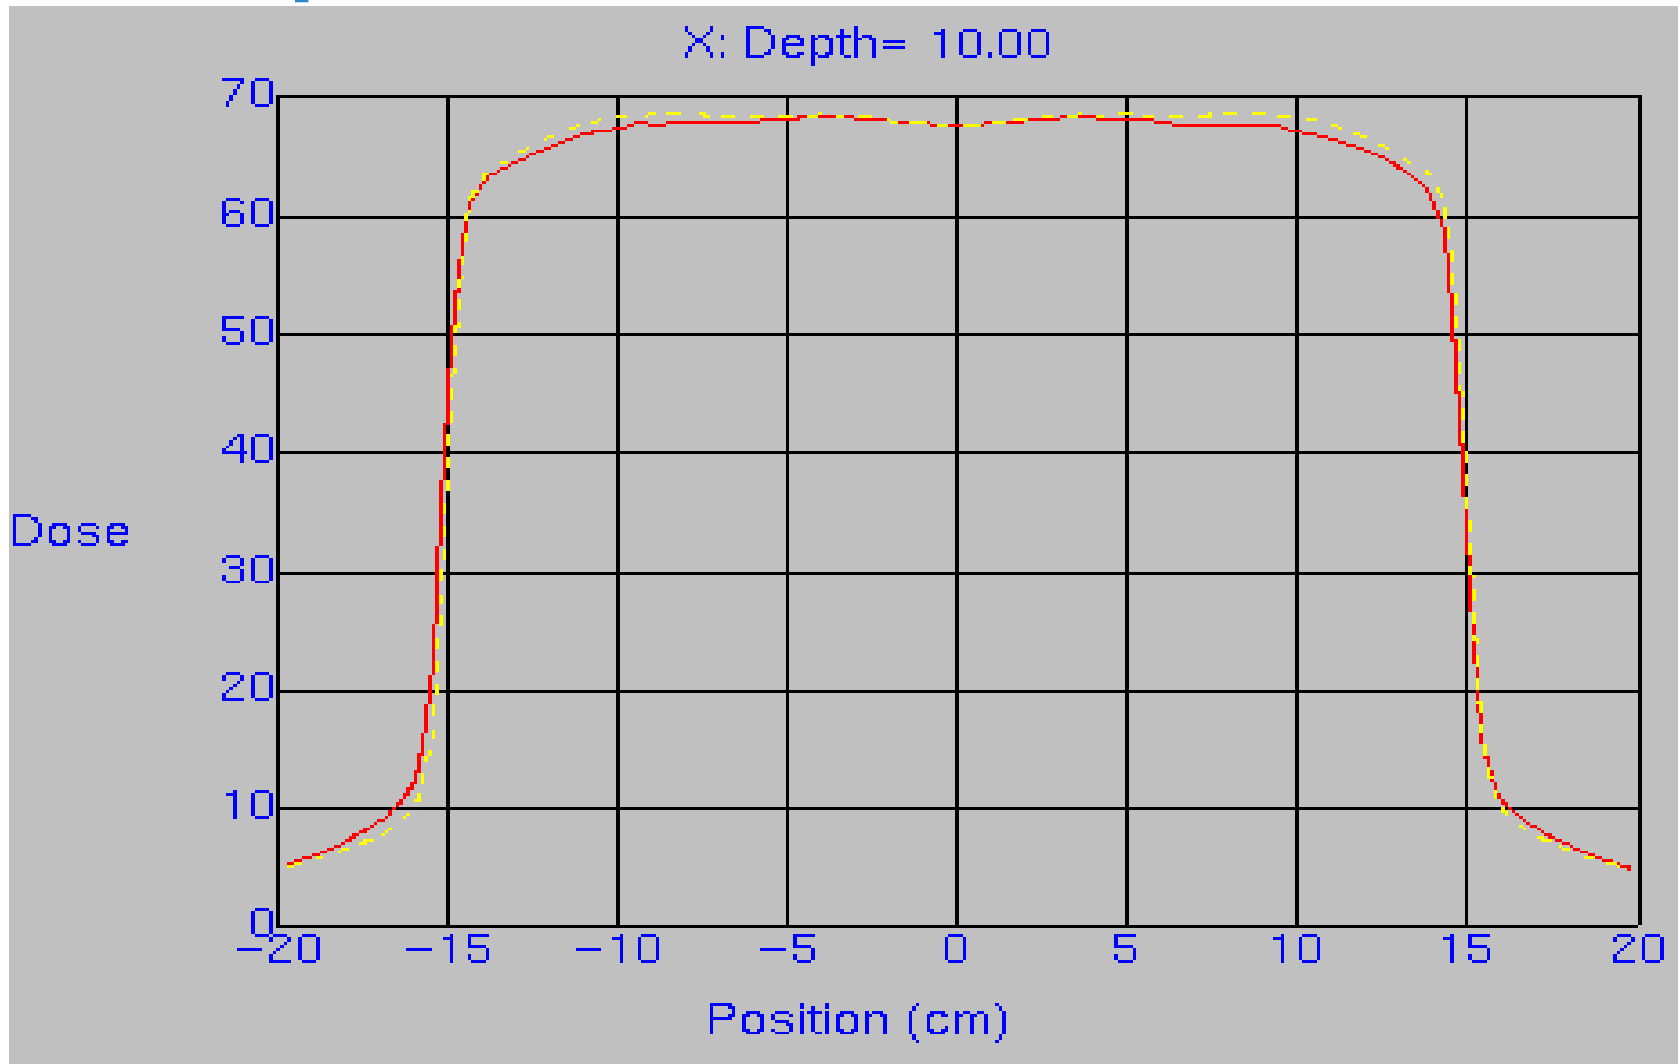

# Open – Clinical model @6MV

X: Depth= 1.50

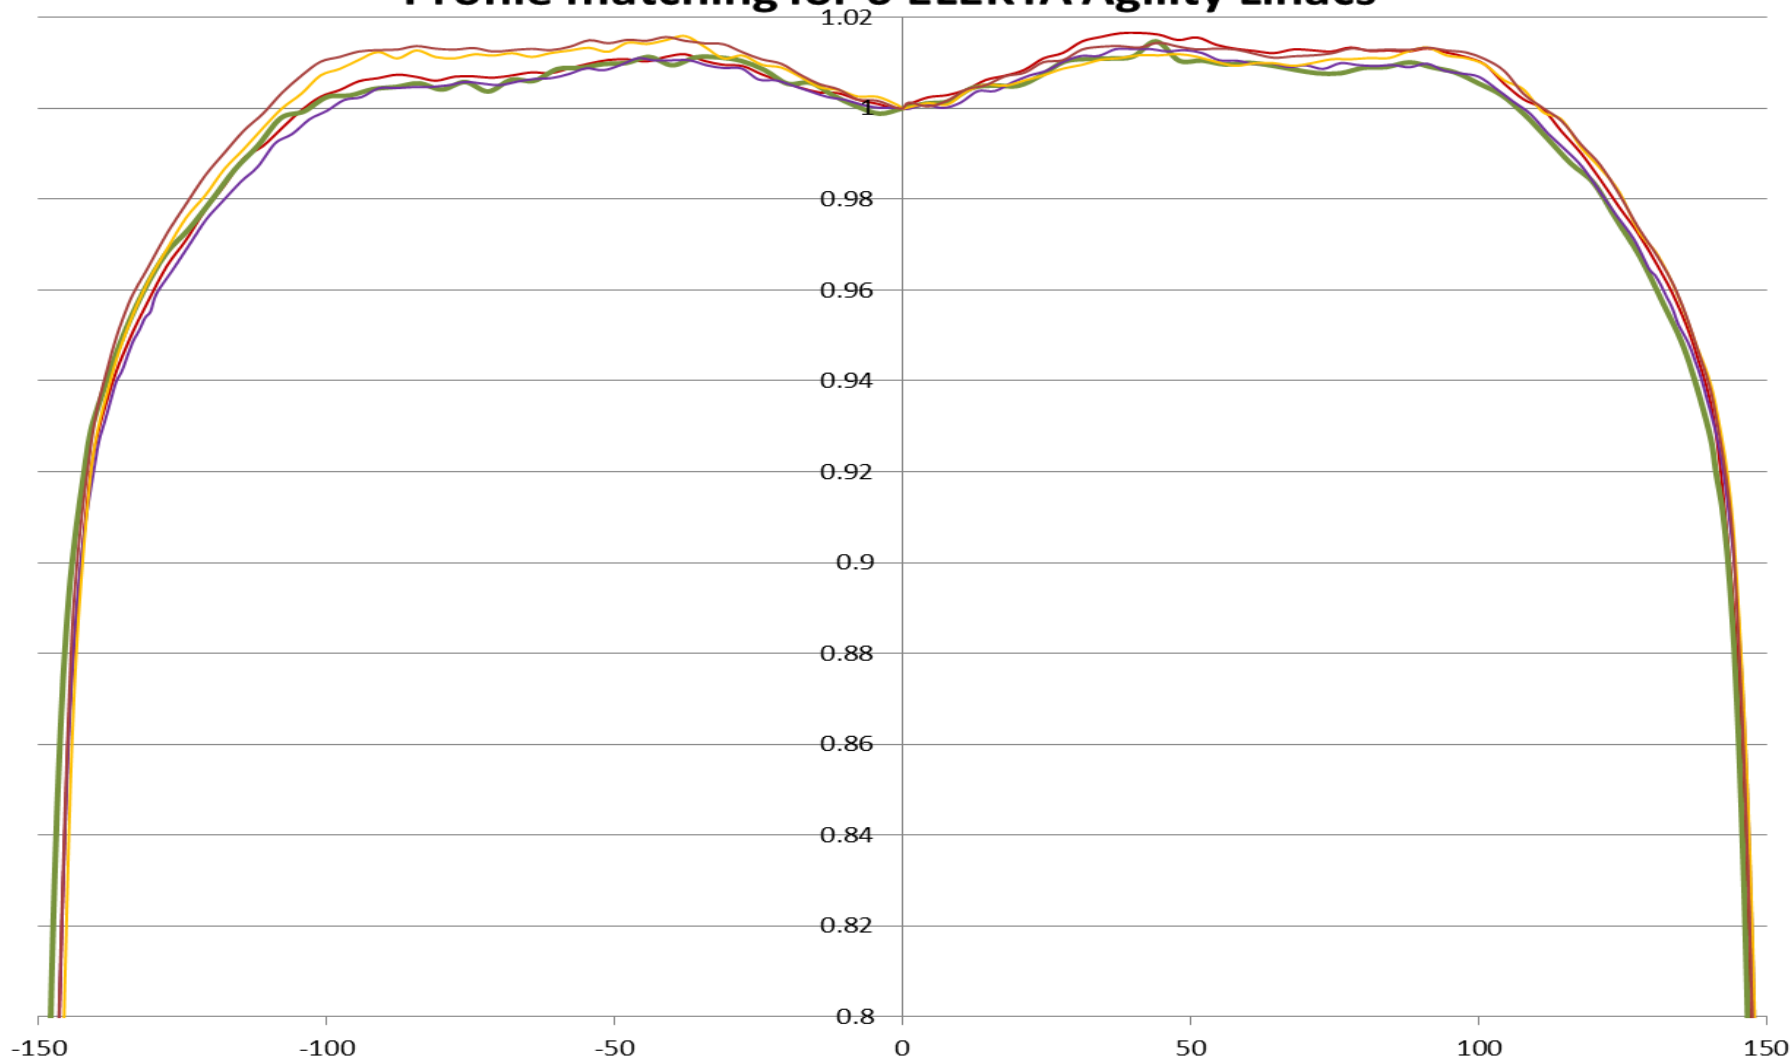

# Open – Clinical model @6MV

# Comparison of radiation beams 6MV

## Profile matching for 6 ELEKTA Agility Linacs

# IQM – Clinical model @6MV

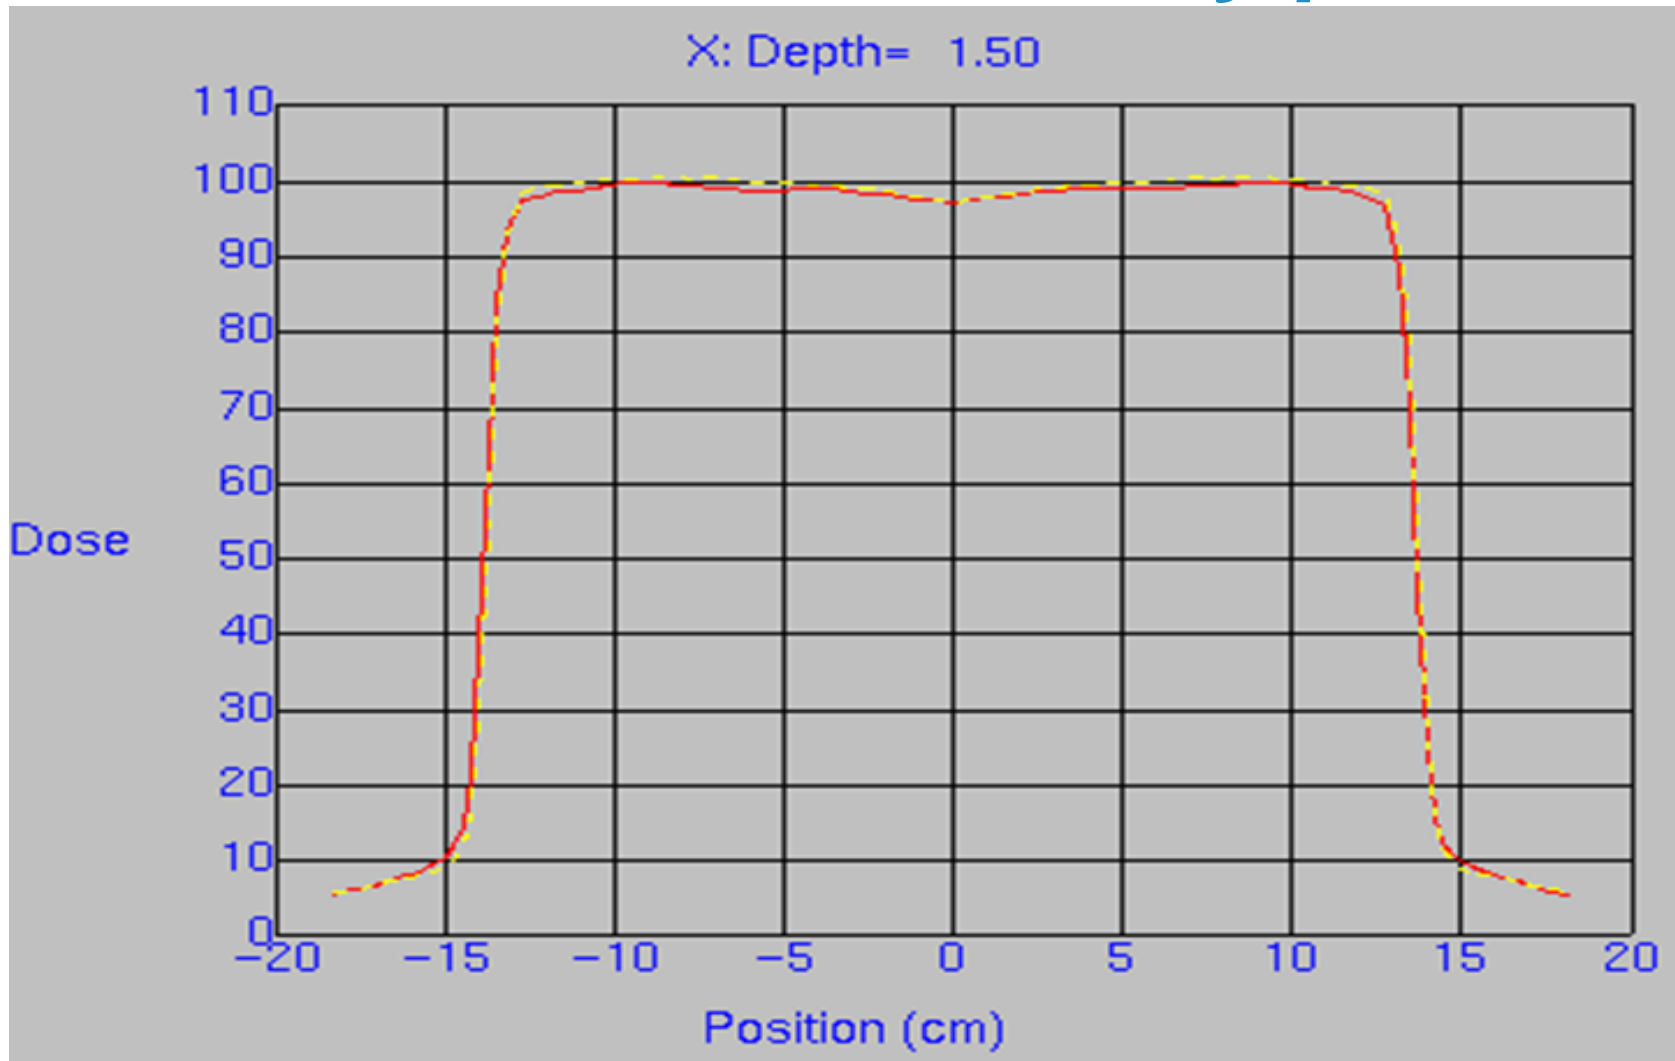

# Open - modified Arbitrary profile

# IQM - modified Arbitrary profile

# Integrating the IQM into Pinnacle 9.8

## Closing the loop- Initial validation

# Integrating the IQM in into P<sup>3</sup>

## Conclusions: 1

- 1. The build up region is modified by the presence of the IQM, reducing 'skin sparing'**
- 2. Smaller field PDD's & Profiles are not affected by IQM**
- 3. Larger fields have shoulders drop, more notably at shallower depths**

# Integrating the IQM in into P<sup>3</sup>

## Conclusions: 2

- 4. Adjustment of arbitrary fluence profile improved agreement – but not observable clinical benefit.**
- 5. Clinical models acceptable at 6MV & 10MV**
- 6. Simple correction factor to change MU's was all that was required in Pinnacle 9.8**

# Integrating the IQM in into P<sup>3</sup>

## Conclusions: 3

- 7. Validation of your clinical models necessary when integrating the IQM into your planning system, but modifications are likely to be small.**
